PROJECT DESIGN PHASE-II

SOLUTION REQUIREMENTS

(FUNCTIONAL & NON-FUNCTIONAL)

Project Name	Indoor Gardening Services Management (IGSM)
Project Type	Individual Project

Introduction

The following functional and non-functional requirements define the proposed Indoor Gardening Services Management (IGSM) solution. The requirements describe the main services the system must provide and the quality characteristics needed for the system to operate effectively.

Part 1: Functional Requirements

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	**Gardening Service Request Management**	• Submit a gardening service request • Select the required service type • Provide plant type and service details • Set request priority • Provide a preferred service date • Generate a request number for the submitted request
FR-2	**Service Request Approval**	• Send submitted requests for manager review • Allow the IGSM Manager to review request details • Allow the manager to approve a request • Allow the manager to reject a request • Update the request state based on the approval decision
FR-3	**Technician Assignment and Service Management**	• Assign approved requests to the IGSM Technician group • Allow technicians to view assigned service requests • Allow technicians to update the service request • Allow technicians to mark the service request as completed
FR-4	**Request Tracking and Notifications**	• Maintain the current state of each service request • Notify the requester when important request updates occur • Notify the requester when the request is approved and assigned • Provide clear request status such as New, Assigned, Rejected, and Completed

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-5	**Gardening Service Information Management**	• Maintain available gardening service types such as Watering, Pruning, and Fertilizing • Maintain plant type information required for the request • Store request description and preferred date • Store service request information in an organized record
FR-6	**Service Request Access Management**	• Allow requesters to access their permitted service request information • Allow technicians to access requests relevant to their work • Allow managers to manage service requests according to their responsibilities • Restrict access based on assigned application roles and permissions

Part 2: Non-functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The system should provide a simple and clear process for creating and managing indoor gardening service requests. Users should be able to understand the request information and available actions easily.
NFR-2	**Security**	The system should restrict access to service request information and actions based on user roles and permissions. Requesters, technicians, and managers should only have the access required for their responsibilities.
NFR-3	**Reliability**	The system should reliably store service request information and maintain the correct request state throughout the service process.
NFR-4	**Performance**	The system should process service requests, approvals, assignments, and status updates within a reasonable response time during normal usage.
NFR-5	**Availability**	The system should be available to authorized users when they need to create, manage, review, or update gardening service requests.
NFR-6	**Maintainability**	The system should be organized so that service requirements, request processes, business rules, and user access can be maintained and updated when required.
NFR-7	**Data Integrity**	The system should maintain accurate and consistent service request information and prevent invalid or inappropriate request state changes.
