*Numbers 1–13 show the end-to-end flow. Solid arrows show the main flow; dashed arrows connect supporting components.*

### Solution Architecture Description

IGSM uses the ServiceNow platform to provide a structured service-management workflow for indoor gardening requests. Users submit requests through the ServiceNow interface using the Garden Record Producer. The IGSM scoped application stores the request in the Indoor Gardening Request table. Flow Designer manages manager approval, technician assignment, requester notification, and completion. Business Rules, Client Scripts, and UI Policies support validation and form behavior, while SLAs track response and completion timelines. Roles and ACLs control access to request information.

### State Flow

Approved path

Alternative outcome

### Data Flow

1. The requester submits plant and service details.
2. The IGSM scoped application creates the Indoor Gardening Request record and stores it in the request table.
3. Flow Designer sends the request to the IGSM Manager for approval.
4. The manager approves or rejects the request; a rejected request is marked Rejected.
5. An approved request is assigned to the IGSM Technicians group and the requester is notified.
6. The technician performs the service and updates the request.
7. The request state is updated to Completed, with SLAs tracking response and completion.
